FURTHER LEISHMANIA/SANDFLY REFERENCES

The two Tables of parasites and their specific vectors contained abbreviated references. Readers may like to have the full references in order to be able to check the originals.

REFERENCES

LAWYER P G and YOUNG D G (in press). Experimental transmission of leishmaniasis to hamsters by the bites of phlebotomine sandflies from the USA. (Diptera: Psychodidae.) Submitted for publication.

How many people noticed the mistake on the front cover of our last issue? The line drawing portrayed a trypanosome, whereas a leptomonad form of a leishmanial organism as shown below should have been printed.
