SUMMARY: Zieve’s syndrome consists of transient haemolytic anaemia, jaundice, hyperlipidaemia and alcohol-induced liver disease. It is rare with less than 75 cases reported in a Medicine literature search from 1966. It can present acutely with abdominal pain.

Case Report

A 39 year old male lorry driver presented with a twenty four hour history of central abdominal pain radiating to the back, fever and vomiting. He drank 20 units of alcohol per day. On examination he was febrile at 38°C and not jaundiced. He showed epigastric rebound tenderness. Fundal examination revealed lipaemia retinalis and venous samples were lipaemic.

Investigation showed: Haemoglobin 13.2g/dl (14-18), amylase 511iu/(16-108), cholesterol 33mmol/l (3.7-5.4), triglycerides 129mmol/l (0.5-2.0), ALT 110iu/l (5-40), gamma GT 324iu/l (10-40), bilirubin 17umol/l, sodium 120mmol/l, potassium 3.2mmol/l, and urea 6.8mmol/l.

He was managed in a surgical unit with a presumptive diagnosis of pancreatitis. Upper gastrointestinal endoscopy and ultrasound of the abdomen were normal.

Following admission his abdominal pain and fever resolved over 5 days. All biochemical values returned to the normal range during this time. However simultaneously his haemoglobin fell to 8.8g/dl, his bilirubin rose to 35mmol/l and he became jaundiced. The blood film and reticulocyte count confirmed haemolysis. The diagnosis was revised to that of Zieve’s syndrome.

His jaundice resolved over 3 days and after 4 weeks without alcohol the patient was clinically asymptomatic with a haemoglobin of 14.1g/dl.

Discussion

In 1958 Leslie Zieve described a syndrome in alcoholic patients of jaundice, hyperlipidaemia and haemolytic anaemia (1). Abnormalities of red cell metabolism have been suggested as a cause of the haemolysis(2). This syndrome can occur in patients with or without pre-existent alcohol liver damage(3).

Melrose reported a series presenting with acute abdominal pain and fever. Hyperlipidaemia was noted to subside prior to the onset of haemolysis (4).

Zieve’s syndrome can present as an acute abdomen. Abstention from alcohol leads to complete clinical remission and prevents recurrence.

Acknowledgements

We thank Lt Col CL Griffiths RAMC, Consultant Surgeon and Lt Col PJ Fabricius RAMC, Consultant Physician for permission to report on their patient.
